Sensitivity Analysis

Applications

Gender Disparities in the Magistrates' Court

Ethnic Disparities in the Crown Court

Conclusion

- Sentencing: the judicial process by which a court determines the punishment for a person convicted of a crime
- In my view, the most consequential criminal justice decision
 - some sentences can destroy (and save) lives
 - offenders and victims, but also their families and communities

Gender Disparities

in the Magistrates' Court

Court

Ethnic Disparities

in the Crown Court

Conclusion

- Sentencing: the judicial process by which a court determines the punishment for a person convicted of a crime
- In my view, the most consequential criminal justice decision
 - some sentences can destroy (and save) lives
 - offenders and victims, but also their families and communities
- Sentencing is also a highly symbolic process
 - purposefully resembling a ceremonial ritual
 - conducted in public, frequently receiving media coverage
- If perceived to be discriminatory...
 - trust in public institutions is undermined
 - and with that compliance with the law

Background: Literature

- Hundreds of studies documenting unwarranted disparities in sentencing
 - according to offender's characteristics: gender, race, nationality, social class, etc.
 - but also according to case, judge or court characteristics: legal defence, political affiliation, volume of cases processed, etc.
 - and even a priori spurious factors: sports results, weather, whether practitioners are hungry, etc.

Conclusion

- Hundreds of studies documenting unwarranted disparities in sentencing
 - according to offender's characteristics: gender, race, nationality, social class, etc.
 - but also according to case, judge or court characteristics: legal defence, political affiliation, volume of cases processed, etc.
 - and even a priori spurious factors: sports results, weather, whether practitioners are hungry, etc.
- In principle none of the above should be affecting sentencing
 - Is the criminal justice system irredeemably unreliable and biased?
- It is complicated (lots of methods problems)
 - most researchers point at unobserved confounder bias
 - the 'differential involvement theory'
 - the field seems stuck in a methodological impasse

Background: Methods

- Experimental designs are problematic
 - vignette studies with judges
 - random allocation of cases across judges

Background

Sensitivity Analysis

Applications

Gender Disparities in the Magistrates' Court

Ethnic Disparities in the Crown Court

Conclusion

- Experimental designs are problematic
 - vignette studies with judges
 - random allocation of cases across judges
- Most studies follow the same research design
 - observational data: court observations, surveys with judges, administrative records, etc.
 - control for as many case characteristics as possible
 - so we can disentangle legitimate from unwarranted disparities
 - “[...] *it is the inclusion of the largest and most detailed set of variables defining the characteristics of the cases processed that distinguishes it from any other study on the topic worldwide;*” (Pina-Sánchez & Grech, 2017)

Conclusion

- Experimental designs are problematic
 - vignette studies with judges
 - random allocation of cases across judges
- Most studies follow the same research design
 - observational data: court observations, surveys with judges, administrative records, etc.
 - control for as many case characteristics as possible
 - so we can disentangle legitimate from unwarranted disparities
 - “[...] *it is the inclusion of the largest and most detailed set of variables defining the characteristics of the cases processed that distinguishes it from any other study on the topic worldwide;*” (Pina-Sánchez & Grech, 2017)
- Is that the right modelling strategy?
 - Could lead to overfitted models
 - and post-treatment bias in particular

Modelling Sentencing Disparities

- The traditional modelling strategy: Control for *all* case characteristics
 - we want to estimate the total effect of judges' perception (X^*) of a given offender characteristic (X) on sentence severity (Y)
 - but need to disentangle that relationship from any other offender or offence characteristics (Z) that might be confounding it

 - however, I do not control for many non-legal factors: e.g. legal defence, demeanour in court, ethnicity, nationality or social class
- According to the E-value:
 - An $OR = 1.37$ would be equal to one in the presence of an unobserved confounder at least 83% more prevalent in male than female offenders, that increases the probability of receiving a custodial sentence by at least 83%
 - we can conclude there is clear evidence of unwarranted disparities, most likely direct discrimination

Conclusion

Ethnic Disparities

- A sample of 8,730 drug offenders sentenced in the Crown Court
- The odds of receiving a custodial sentence are 42% higher for ethnic minority compared to White offenders
- We can only control for a few relevant case characteristics
 - offence type, guilty plea, previous convictions, age and gender
- However, we can only find one objectively defined case characteristic that could explain that result

Case characteristic	Post-treatment	Favours	Prevalence in Whites	Prevalence in Blacks
Aggravating: high purity	Pre	Blacks	0.11	0.07
Mitigating: addicted to the same drug	Pre	Whites	0.18	0.11
Mitigating: genuine remorse	Post	Whites	0.28	0.19
Mitigating: determination to rehabilitate	Post	Whites	0.15	0.09
Mitigating: lack of maturity	Post	Blacks	0.07	0.13

Ethnic Disparities

- A sample of 8,730 drug offenders sentenced in the Crown Court
- The odds of receiving a custodial sentence are 42% higher for ethnic minority compared to White offenders
- We can only control for a few relevant case characteristics
 - offence type, guilty plea, previous convictions, age and gender
- However, we can only find one objectively defined case characteristic that could explain that result

Case characteristic	Post-treatment	Favours	Prevalence in Whites	Prevalence in Blacks
Aggravating: high purity	Pre	Blacks	0.11	0.07
Mitigating: addicted to the same drug	Pre	Whites	0.18	0.11
Mitigating: genuine remorse	Post	Whites	0.28	0.19
Mitigating: determination to rehabilitate	Post	Whites	0.15	0.09
Mitigating: lack of maturity	Post	Blacks	0.07	0.13

- Clear evidence of unwarranted disparities, hard not to conclude direct discrimination

Conclusion

Conclusion

- When modelling disparities in sentencing, we should stop trying to control for everything
 - many factors are defined by the judge
 - we might be explaining away the effect we seek to estimate

Conclusion

Conclusion

- When modelling disparities in sentencing, we should stop trying to control for everything
 - many factors are defined by the judge
 - we might be explaining away the effect we seek to estimate
- I suggest a 4-step modelling framework:
 - 1 Define disparities
 - 2 Consider what controls are needed
 - 3 Model sequentially, report bounded estimates
 - 4 Employ sensitivity analysis

Conclusion

- When modelling disparities in sentencing, we should stop trying to control for everything
 - many factors are defined by the judge
 - we might be explaining away the effect we seek to estimate
- I suggest a 4-step modelling framework:
 - 1 Define disparities
 - 2 Consider what controls are needed
 - 3 Model sequentially, report bounded estimates
 - 4 Employ sensitivity analysis
- There is evidence of gender and ethnic discrimination in sentencing in England and Wales
 - although the latter appears limited to drug offenders and not across all ethnic minority groups
